2.1.2. Dictionary Operations

11:35

Write a Python program to perform insertion, update, deletion, and traversal operations on a dictionary. An initial dictionary containing 10 predefined records is already given in the program.

Operations to be Performed:

1. Insertion – Insert a new key-value pair into the dictionary using user input.
2. Update – Update the value of an existing key using user input.
3. Deletion – Delete a specified key from the dictionary using user input.
4. Traversal – Traverse the final dictionary and display all key-value pairs.

Input and Output Format:

1. Read an integer representing the key to be inserted and a string representing its value. Insert this new key-value pair into the dictionary and display the dictionary after insertion.
2. Read an integer representing the key to be updated and a string representing the new value. Update the value of the specified key (only if it exists) and display the dictionary after the update.
3. Read an integer representing the key to be deleted. Delete the specified key from the dictionary (only if it exists) and display the dictionary after deletion.
4. Finally, traverse the dictionary and display all key-value pairs.

The program should also display the original dictionary before performing any operations. Each output should be printed with appropriate messages.

Note:

- All operations must be performed using dictionary methods.
- Perform deletion only if possible; leave the dictionary unchanged.
- Refer to the visible test cases for better understanding and strictly match with the input/outputs.

Sample Test Cases

DictOper...

1 # Initial dictionary with 10 predefined records
2 student = {
3 1: "Amit",
4 2: "Riya",
5 3: "Kiran",
6 4: "Neha",
7 5: "Arjun",
8 6: "Pooja",
9 7: "Rahul",
10 8: "Sneha",
11 9: "Vikram",
12 10: "Anjali"
13 }
14
15 print("Original Dictionary:", student)
16
17 # Insertion
18 key_insert = int(input())
19 value_insert = input()
20 student[key_insert] = value_insert
21
22 print("After Insertion:", student)
23
24 # Update
25 key_update = int(input())
26 value_update = input()
27
28 if key_update in student:
29 student[key_update] = value_update
30
31 print("After Update:", student)
32
33 # Deletion
34 key_delete = int(input())
35

2.2.1. Linear search Technique05:45

Write a program to check whether the given element is present or not in the array of elements using linear search.

Input format:

- The first line of input contains the array of integers which are separated by space
- The last line of input contains the key element to be searched

Output format:

- If the element is found, print the index. If the element found multiple times, print the starting index
- If the element is not found, print **Not found**.

Sample Test Case:

Input:

1 2 3 4 3 5 6

3

Output:

2

Sample Test Cases

CTP1709...

1arr = list(map(int, input().split()))

2key = int(input())

3found = False

4for i in range(len(arr)):

5 if arr[i] == key:

6 print(i)

7 found = True

8 break

9if not found :

10 print("Not found")

2.2.2. Captain of the Team

05:02

You are provided with the heights of 11 cricket players (in centimeters). Your task is to identify the tallest player, who will be selected as the captain of the team.

Input Format:

The first line of input will contain 11 integers, each representing the height of a player (in centimeters), each separated by a space.

Output Format

The output should be the height (in centimeters) of the tallest player.

Sample Test Cases

Explorer

captainof...

Submit

```
1 heights =
2 list(map(int,input().split()))
3 tallest_player = max(heights)
4 print(tallest_player)
```
